SUMMARY

I've spent nine years building and operating backend systems, the last four of them running the platform team at a logistics startup as it scaled from one region to nationwide coverage. I like the parts of the job other people avoid: on-call design, migrations with no downtime window, and the long tail of cleanup after an incident. This is placeholder example content — replace it with your own summary.

EXPERIENCE

Staff Platform Engineer — Example Logistics Co.

2022 – Present

I lead the platform team responsible for the shared infrastructure every product team at the company builds on.

- ▶ Led the migration of the order-routing service from a single-region deployment to a multi-region active-active setup, cutting failover time from twenty minutes to under thirty seconds.
- ▶ Redesigned the on-call rotation and alerting after a quarter where the team was paged an average of nine times a week. Cut that to under two by fixing root causes instead of adding runbooks for the symptoms.
- ▶ Introduced a staged rollout process for backend deploys, gating each stage on error-rate and latency thresholds pulled from existing dashboards. Bad deploys now reach a small fraction of traffic instead of everyone.
- ▶ Hired and ran a team of four engineers, including two promotions from mid-level to senior during my time leading the group.

Backend Engineer — Example Logistics Co.

2020 – 2022

- ▶ Rebuilt the billing reconciliation pipeline after recurring discrepancies were traced to a race condition in the original implementation. Discrepancies dropped to zero over the following two quarters.
- ▶ Owned the transition from a monolithic Rails application to a set of services with clear ownership boundaries, starting with the two highest-traffic endpoints.

Software Engineer — Prior Company Example

2017 – 2020

- ▶ Built the internal tooling used by support staff to investigate and resolve customer-reported order issues, cutting average resolution time by half.

- Wrote the integration layer connecting the product to a third-party payments provider, including its retry and idempotency handling.

TECHNICAL

Infrastructure Kubernetes · Terraform · AWS (EC2, RDS, S3, Lambda) · Docker

Operations Prometheus · Grafana · PagerDuty · incident response · on-call design

Languages Go · Python · Ruby · SQL

Data PostgreSQL · Redis · Kafka

EDUCATION

B.Sc., Computer Science — Example State University, 2017
